

# Enter The Vue CLI

Moving to the vue cli, what to expect,  
how to stay sane and enjoy vue's exciting  
development environment

**Vue CLI**

# Vue cli

Out-of-the-box support for Babel, TypeScript, ESLint, PostCSS, PWA, Unit Testing & End-to-end Testing. The plugin system allows the community to build and share reusable solutions to common needs. Vue CLI is fully configurable without the need for ejecting. This allows your project to stay up-to-date for the long run. Create, develop and manage your projects through an accompanying graphical user interface.

Translation - Vue.js on a more complex level but simple if you ***follow a guide...***

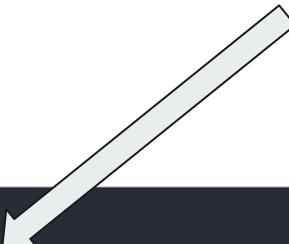

## Step 1 - Install

You will need to install the vue-cli installer on your computer as a global. 'global' means you will be able to access the vue-cli from any project on your computer.

Install:

```
npm install -g @vue/cli  
# OR  
yarn global add @vue/cli
```

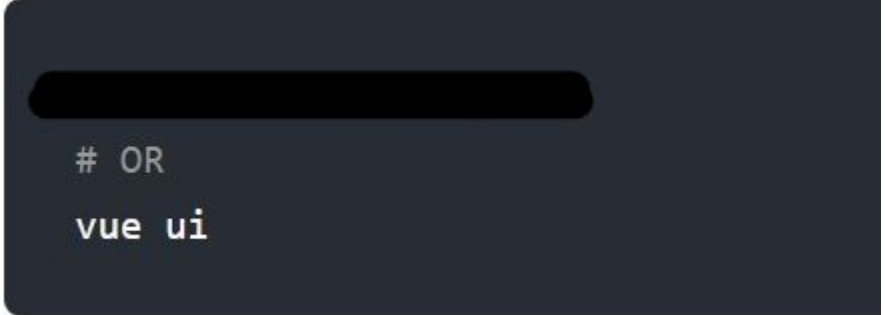

Pls use npm

## Step 2 - Launch Vue's UI tool

Vue has created an awesome GUI tool that allows you to create projects with ease. To use it run **vue ui** after vue has finished installing.

Create a project:

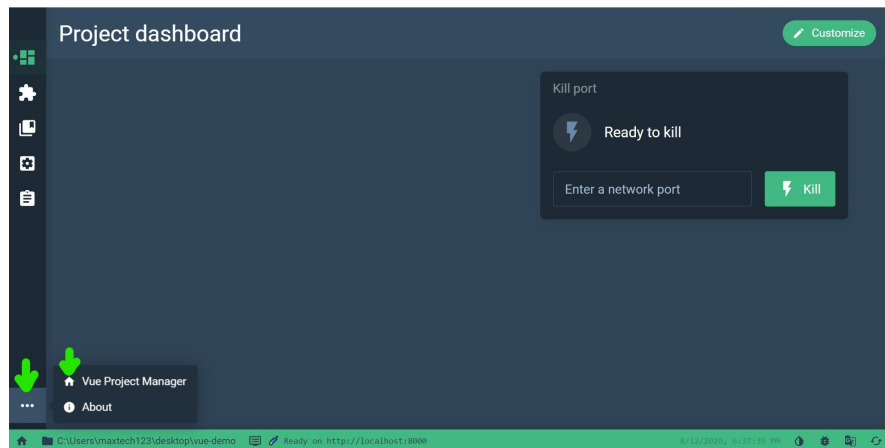

```
# OR
```

```
vue ui
```

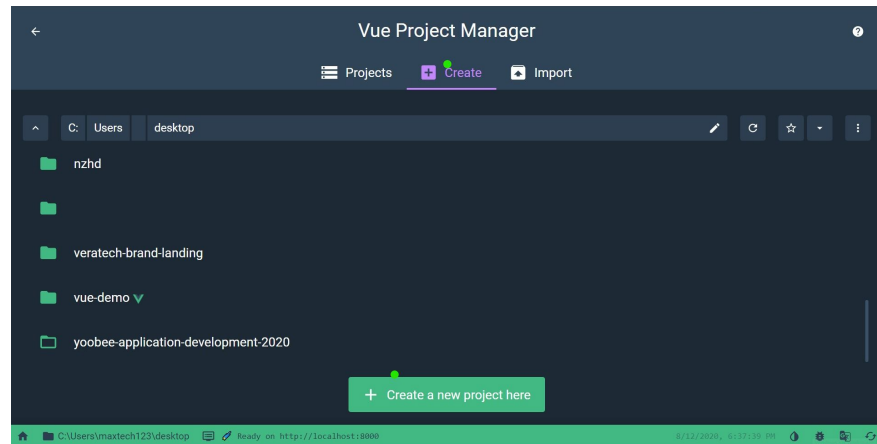

## Step 3 - Launch Vue's UI tool

Vue's ui opens in the browser, to create a new project click on the links indicated in the picture.

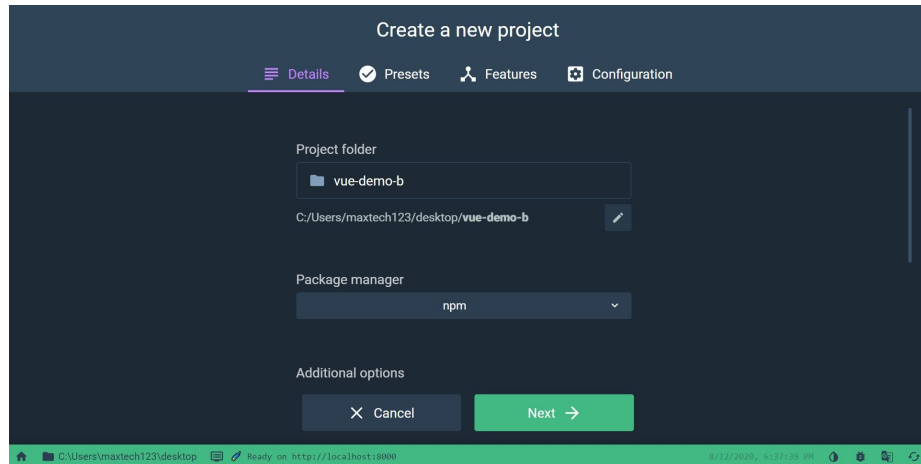

## Step 4 - Create a new project

Click create then choose a place on your computer to create a new project. Finally click the create a new project button

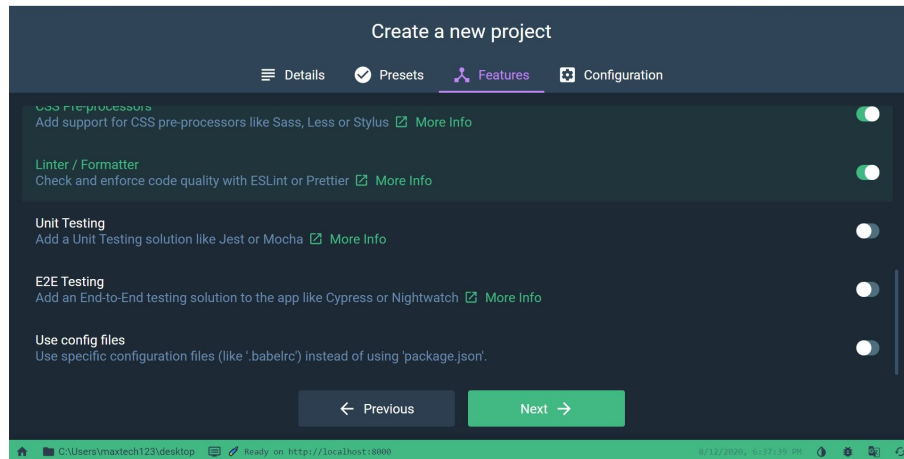

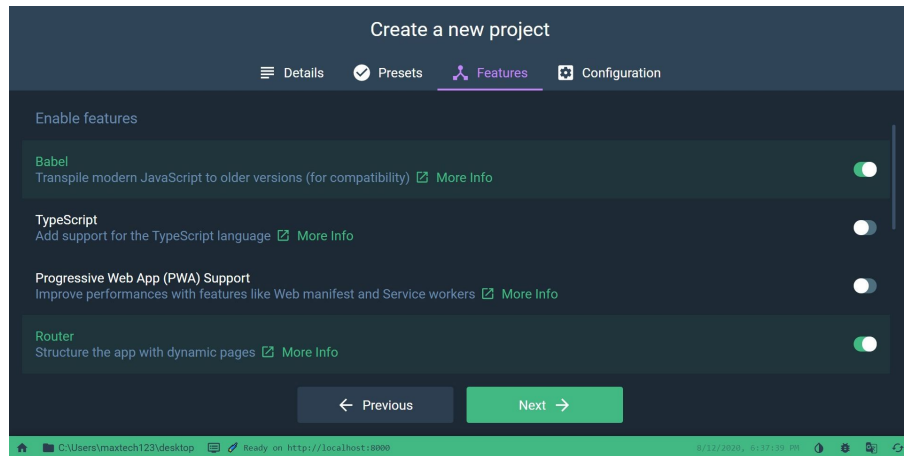

# Step 5 - Naming options

Name the folder and select npm as your package manager. Do not worry about the additional options further down the page. Click [next](#).

# Step 7 - Select Presets

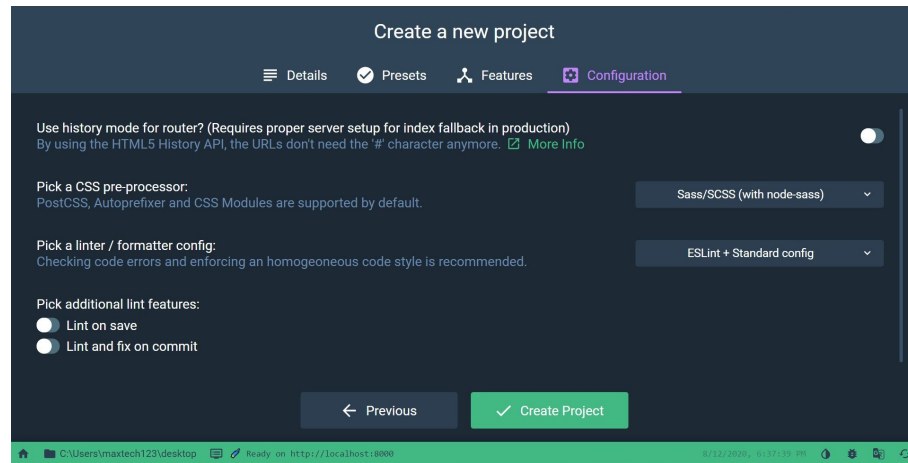

Turn **all options on** except for *Typescript*, *PWA support*, *Unit Testing*, *E2E*, and *config files* === *off*.

# Step 9 - Select Presets con't

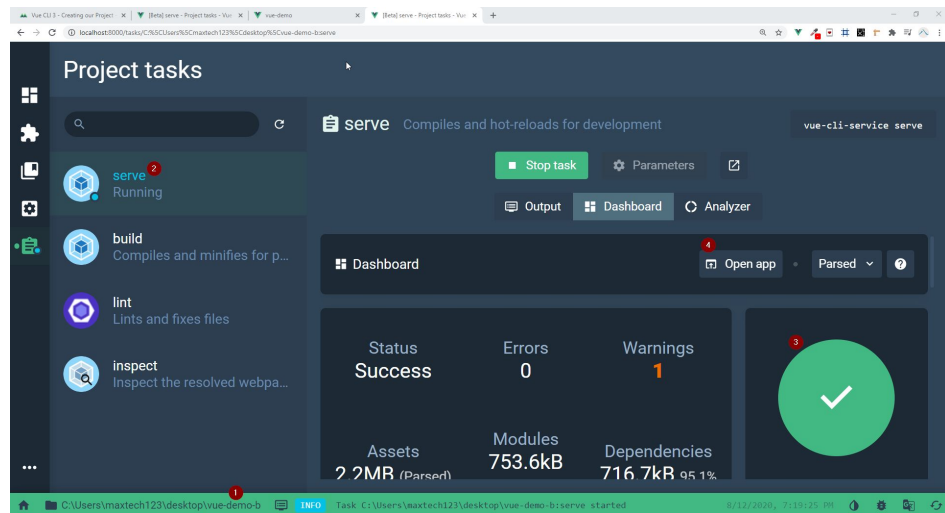

Choose node-sass and you preferred style guide for javascript. Leave all other features the same. Ignore creating a preset name at the next step...

# Step 10 - Use project tasks

Choose node-sass and you preferred style guide for javascript. Leave all other features the same. Ignore creating a preset name at the next step...

1. The current dir and application in focus
2. Click to serve the application locally
3. Shows the status of the application serve
4. Click to launch the app on the right port in the browser

# Step 11 - Congratulations

You made it, the latest, greatest, modern version of front end development is now installed and ready to roll. Next... how do we actually navigate through it, and use it.
